ABSTRACT

Dysphonia plica ventricularis (DPV) is a type of functional dysphonia (FD) which can be caused by several reasons. DPV-emotional type is seen secondary to emotional crisis which is equivalent to psychogenic/dissociative dysphonia. Here we describe a case of DPV secondary to emotional dysregulation with an underlying emotionally unstable personality disorder. Crisis intervention and emphasis on regular compliance to treatment has been discussed.

Keywords: Dysphonia plica ventricularis, Emotionally unstable personality disorder, Dissociation.
